

AI ASSISTANT CODING

ASSIGNMENT-(4.3)

2303A52T02

BT-50

TASK-1

:

PROMPT

Use zero-shot prompting to instruct an AI tool to generate a Python function that:

- Accepts a year as input
- Checks whether the given year is a leap year
- Returns an appropriate result give a python code.

CODE

```
def is_leap_year(year):
```

```
    """
```

```
    Check if a given year is a leap year.
```

```
    A year is a leap year if:
```

```
    - It is divisible by 4
```

```
    - Except for years that are divisible by 100, unless they are also divisible
```

```
    by 400 Parameters:
```

```
    year (int): The year to check
```

```
    Returns:
```

```
    bool: True if the year is a leap year, False otherwise
```

```
    """
```

```
    if (year % 4 == 0 and year % 100 != 0) or (year % 400 == 0):
```

```
        return True
```

```
    else:
```

```
        return False
```

Sample input and output

year = 2020

if is_leap_year(year):

 print(f"{year} is a leap year.")

else:

 print(f"{year} is not a leap year.")

OUTPUT

```
SyntaxError: invalid character ' ' (0x2022)
PS C:\Users\EDIT\OneDrive\Desktop\CSE-4> & C:\Users\EDIT\AppData\Local\Programs\Python\Python313\python.exe c:/Users/EDIT/OneDrive/Desktop/CSE-4/AI-4.3.py
2020 is a leap year.
PS C:\Users\EDIT\OneDrive\Desktop\CSE-4> 
```

Check whether a given year is leap year or not. For that we apply conditions like the year is divisible by 4 and Except for years that are divisible by 100, unless they are also divisible by 400.

TASK-2:

PROMPT

Use one-shot prompting by providing one input-output example to generate a Python function that:

- Converts centimeters to inches
 - Uses the correct mathematical formula
- Example provided in prompt:

Input: 10 cm → Output: 3.94 inches give a python code.

CODE

```
def cm_to_inches(cm):
```

```
    """
```

```
    Convert centimeters to inches.
```

Parameters:

cm (float): Length in centimeters

Returns:

float: Length in inches

```
"""
```

```
    inches = cm / 2.54
```

```
    return inches
```

```
# Sample test cases
```

```
test_values = [10, 25.4, 50, 100]
```

```
for cm in test_values:
```

```
    inches = cm_to_inches(cm)
```

```
    print(f'{cm} cm is equal to {inches:.2f} inches.')
```

OUTPUT

```
PS C:\Users\EDIT\OneDrive\Desktop\CSE-4> & C:\Users\EDIT\AppData\Local\Programs\Python\Python313\python.exe c:/Users/EDIT/OneDrive/Desktop/CSE-4/AI-4.3.py
10 cm is equal to 3.94 inches.
25.4 cm is equal to 10.00 inches.
50 cm is equal to 19.69 inches.
100 cm is equal to 39.37 inches.
PS C:\Users\EDIT\OneDrive\Desktop\CSE-4> 
```

Here we convert cm to inches by using formula $\text{inch} = \text{cm} / 2.54$ and give some test values to convert it into inches and print the inches output.

TASK-3

PROMPT

se few-shot prompting with 2–3 examples to generate a Python function that:

- Accepts a full name as input
- Formats it as “Last, First”. Using few shot prompt write a python code.

CODE

```
def format_name(full_name):
    """    Format a full name as "Last, First".

    Parameters:
    full_name (str): The full name in "First Last" format

    Returns:
    str: The formatted name in "Last, First" format
    """

    parts = full_name.split()
    if len(parts) != 2:
        raise ValueError("Input must be in 'First Last' format")

    first, last = parts

    return f"{last}, {first}"

# Sample inputs and outputs
test_names = ["John Smith", "Anita Rao", "Michael Jordan"]
for name in test_names:
    formatted_name = format_name(name)

    print(f"Original: {name} → Formatted: {formatted_name}")
```

OUTPUT

```
s/EDIT/OneDrive/Desktop/CSE-4/AI-4.3.py
Original: John Smith → Formatted: Smith, John
Original: Anita Rao → Formatted: Rao, Anita
Original: Michael Jordan → Formatted: Jordan, Michael
PS C:\Users\EDIT\OneDrive\Desktop\CSE-4> █
```

Format a full name as "Last, First". Parameters full_name (str) The full name in "First Last" format .Returns str: The formatted name in "Last, First" format.

TASK-4

PROMPT

Use zero-shot prompting to generate a function that counts vowels in a string

- Use few-shot prompting for the same problem
- Compare both outputs based on:
 - o Accuracy
 - o Readability
 - o Logical clarity

CODE

```
def count_vowels_zero_shot(s):
```

```
    """
```

```
    Count the number of vowels in a string.
```

```
    Parameters:
```

```
    s (str): Input string
```

```
    Returns:
```

```
    int: Number of vowels in the
```

```
    string """
```

```
    vowels = "aeiouAEIOU"
```

```
    count = 0
```

```
    for char in s:
```

```
        if char in vowels:
```

```
            count += 1
```

```
    return count
```

```
# Few-Shot Prompting Function
```

```
def count_vowels_few_shot(s):
```

```
"""
```

Count the number of vowels in a string.

Examples:

Input: "hello" → Output: 2

Input: "world" → Output: 1

Parameters:

s (str): Input string

Returns:

int: Number of vowels in the

string """

```
vowels = "aeiouAEIOU"
```

```
count = sum(1 for char in s if char in vowels)
```

```
return count
```

```
# Sample Input and Output Testing
```

```
test_strings = ["hello", "world", "AI is fun", "Python programming"]
```

```
print("Zero-Shot Prompting Results:")
```

```
for s in test_strings:
```

```
    print(f"Input: '{s}' → Vowel Count:
```

```
{count_vowels_zero_shot(s)}") print("\nFew-Shot Prompting
```

```
Results:")
```

```
for s in test_strings:
```

```
    print(f"Input: '{s}' → Vowel Count: {count_vowels_few_shot(s)}")
```

OUTPUT

```

PS C:\Users\EDIT\OneDrive\Desktop\CSE-4> & C:\Users\EDIT\AppData\Local\Programs\Python\Python313\python.exe c:/User
s/EDIT/OneDrive/Desktop/CSE-4/AI-4.3.py
Zero-Shot Prompting Results:
Input: 'hello' → Vowel Count: 2
Input: 'world' → Vowel Count: 1
Input: 'AI is fun' → Vowel Count: 4
Input: 'Python programming' → Vowel Count: 4

Few-Shot Prompting Results:
Input: 'hello' → Vowel Count: 2
Input: 'world' → Vowel Count: 1
Input: 'AI is fun' → Vowel Count: 4
Input: 'Python programming' → Vowel Count: 4
PS C:\Users\EDIT\OneDrive\Desktop\CSE-4> 

```

Using zero shot prompting and few shot prompting find number of vowels in a string.

TASK-5

PROMPT

Use few-shot prompting to generate a Python function that:

- Reads a .txt file
- Counts the number of lines in the file
- Returns the line count GIVE A PYTHON CODE

CODE

```
def count_lines_in_file(file_path):
```

```
    """
```

Count the number of lines in a text file.

Parameters:

file_path (str): Path to the text file

Returns:

int: Number of lines in the file

```
    """
```

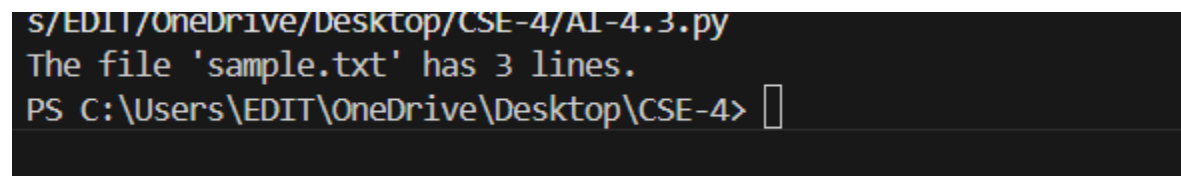

```
with open(file_path, 'r') as file:
    lines = file.readlines()
    return len(lines)

# Sample Input and Output Testing
if __name__ == "__main__":
    sample_file = 'sample.txt'

    # Create a sample text file for demonstration
    with open(sample_file, 'w') as f:
        f.write("Hello, World!\n")
        f.write("This is a sample file.\n")
        f.write("It has multiple lines.\n")

    line_count = count_lines_in_file(sample_file)
    print(f"The file '{sample_file}' has {line_count} lines.")
```

OUTPUT

```
s/EDIT/OneDrive/Desktop/CSE-4/A1-4.3.py
The file 'sample.txt' has 3 lines.
PS C:\Users\EDIT\OneDrive\Desktop\CSE-4>
```

EXPLANATION

Count the number of lines in a text file.
